ABOUT ME

AI/ML undergrad who builds and ships full-stack products — production-deployed platforms, real payment integrations, and end-to-end pipelines — with a focus on clean architecture and measurable outcomes. Looking to bring hands-on experience in full-stack engineering and agile delivery to a team building real products for real users.

EDUCATION

Vasavi College of Engineering <i>B.E. in CSE (AI/ML); CGPA: 8.65 Top 20% of branch</i>	Hyderabad, India 2024 – 2028
Sri Chaitanya Junior College <i>Intermediate (MPC) – 96%</i>	Hyderabad, India 2022 – 2024

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, Java, C/C++, SQL, Dart, HTML/CSS
Frameworks: Next.js, React, Node.js, Express, Flask, Flutter
AI / ML: TensorFlow, PyTorch, OpenCV, LangChain, LLM Integration, Ollama, Edge AI
Automation: Workflow Automation, Agentic AI Pipelines, API Integration, GitHub Webhooks, CI/CD, Cron Jobs
Infrastructure: Supabase, Docker, AWS, JWT, REST APIs, Cloudflare, GitHub Actions, Vercel, Git
IoT / Embedded: ESP32, LoRa, GSM, GPS

PROJECTS

- Jacro – E-Commerce Platform** | *Next.js, TypeScript, Node.js, Supabase, Flutter, Docker, AWS* | [GitHub](#) | [Live](#)
- Built a production-deployed luxury fashion e-commerce platform — measured by live customer transactions and a 20+ endpoint REST API covering auth, cart, wishlist, and order management — by architecting a Next.js storefront backed by Node.js/Express and Supabase (PostgreSQL), containerized with Docker and deployed on AWS.
 - Eliminated 100% of manual order-notification overhead — measured by zero-touch confirmation delivery to both customer and store owner on every checkout — by integrating Razorpay payments and automating the full notification workflow via CI/CD pipelines, secured with JWT auth, Cloudflare Turnstile CAPTCHA, and tiered rate limiting.
 - Deployed a cross-platform admin tool (web, Android, iOS, macOS, Windows) from a single Flutter codebase for owner-only inventory management, and integrated an LLM-powered support chatbot (Ollama) with live Supabase context injection — zero external API dependency.
- VOSC – LLM Git Contribution Intelligence** | *JavaScript, Supabase, Octokit, GitHub Webhooks* | [GitHub](#)
- Engineered an event-driven pipeline using Octokit to fetch PRs across all repositories, run LLM-based quality analysis on each diff, and persist CWE-mapped scores to Supabase via GitHub webhooks — sub-minute latency from commit push to scored leaderboard.
 - Automated the full PR lifecycle — measured by event-driven WhatsApp and email alerts for open, merge, close, and review events — replacing a manual days-long process with zero human intervention.
 - Demonstrates supply-chain awareness: verifying contributor identity, scoring diff quality, and maintaining an auditable contribution record.
- SPECTRE – Automated Network Recon & Security Analysis** | *Python, Flask, Nmap, Amass* | [GitHub](#)
- Developed an automated reconnaissance platform orchestrating Nmap, Amass, Nikto, WhatWeb, and SpiderFoot to perform comprehensive network and OSINT-based infrastructure discovery with zero manual handoff.
 - Developed an intelligent correlation engine linking findings across tools to map vulnerabilities to CWE classifications; risk scored 0–100 via CVSS/NVD correlation — reduced manual audit time by ~70%.
 - Developed a Flask-based API and real-time web dashboard with automated JSON/CSV/HTML report generation.

AWARDS & ACHIEVEMENTS

- HackSavvy – 1st Place** (MGIT): STOMA, an edge AI irrigation system using IoT sensors to autonomously manage plant stress.
- Innovasia – 2nd Place** (VCE): SPECTRE, automated cybersecurity recon platform with CWE-mapped risk scoring.
- Feature Engineering Hackathon – 1st Place** (VCE): Optimized ML pipeline with feature extraction, transformation, and dimensionality reduction.
- Generative AI Hackathon – 4th Place** (VCE): StyleAI, LLM-powered fashion recommendations using Groq LLaMA 3.3 and OpenCV.
- Model United Nations:** 8 conferences — 3 Verbal Mentions, 1 Honorable Mention.
